From 7/2015 to 12/2018, 205 consecutive patients underwent RDB implantation. Of these, 200 (97.6%) were discharged with a RDB (in 5 patients RDB was replaced intraoperatively with a stented bioprosthesis due to significant regurgitation) and represent the population of this study. At discharge, PPM was found in 13 patients (6.5%): moderate in 11 (5.5%) and severe in 2 (1%). Valve size distribution, incidence of PPM and hemodynamic data for each valve size are shown in Figure 1. At 30 days, mortality (0% vs. 0.5%, p=1), myocardial infarction (0% vs. 0.5%, p=1), stroke (0% vs. 1%, p=1), and pacemaker implantation (7.7% vs. 7.5%, p=1) were similar between patients with and without PPM. Median follow-up was 379 days (IQR: 20-772). Late mortality occurred in 4 patients (2%) and none had PPM at discharge (p=1). Re-hospitalization for heart failure occurred in 5 patients (2.5%) two of them with PPM (one moderate and one severe) (p=0.035).
